

Inline highlight chips

Text on a rounded background, on the baseline — **inline code and status badges**. Add the `graph-compose` dependency from `io.github.demchaav`.

`code(text)` — monospace on a light chip, engine defaults

Run `./mvnw verify` before pushing, and `-Dtest=Name` to narrow it to one class

`chip(text, fg, bg)` — a coloured status badge between words

`Paid`

`Overdue`

`On hold`

`highlight(text, style, bg, radius, padding)` — the full primitive

`Pill`

`rounded`

`square`

`sharp`

a multi-word highlight wraps across lines — one continuous fill per fragment

Reviewer note: `this longer highlighted phrase is intentionally verbose so that it spans more than one visual line, and the engine still paints a continuous rounded chip on each line fragment rather than one box per word` — done.
