GraphCompose to Word, from one document

This file exists twice: a fixed-layout **PDF** and an editable **DOCX** exported from the same session. Inline runs — *italic,* colored, **bold accents** — survive in both.

Lists stay Word lists, with their markers

- Flat items use the list marker
- Word gets one paragraph per item

• Nested authoring
  » Each depth is a level of one Word list
    · Custom markers survive the export

Tables stay tables, and keep their paint

Quarter	Revenue	Profit
Q1	42	12
Q2	55	17
Q3	61	21
Q4	70	26

Side-by-side rows become one-row tables

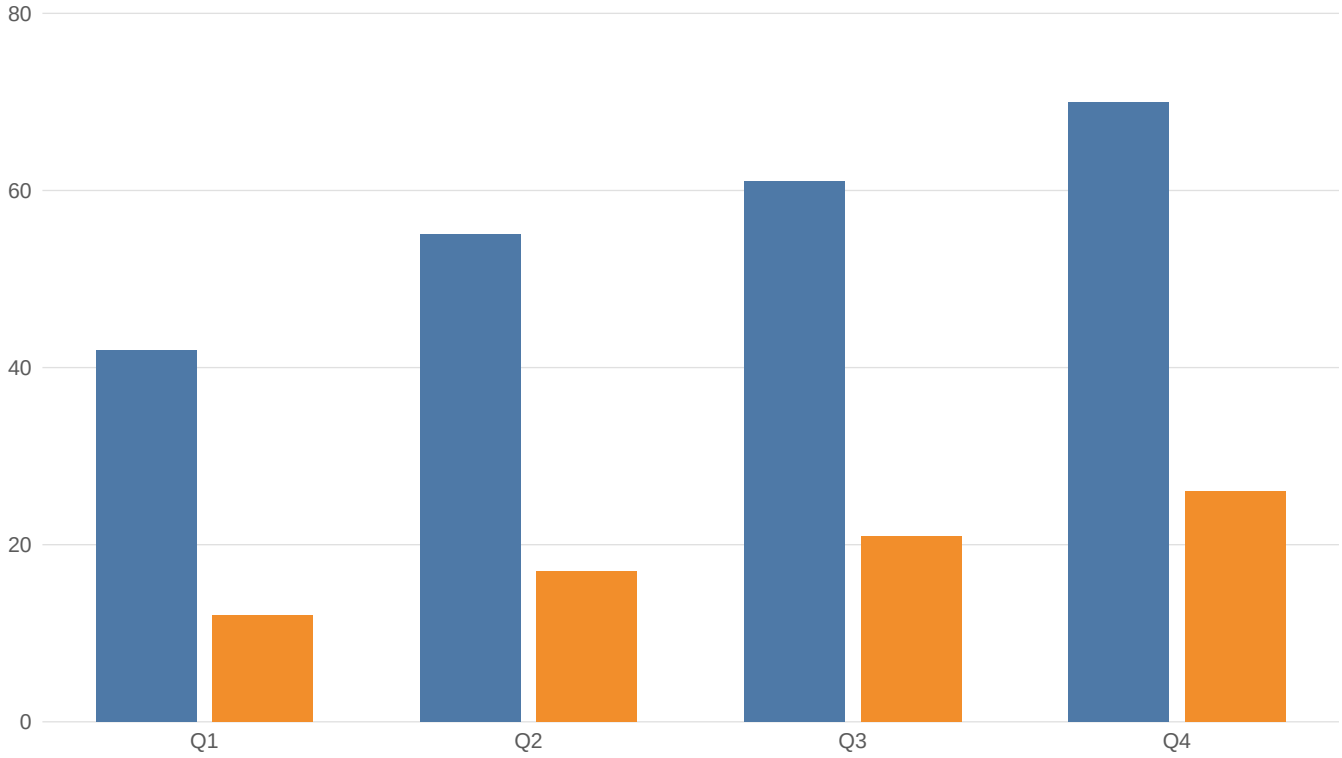
Left cell — editors keep the columns.

Right cell — content stays editable.

Images embed at their declared size

Charts become Word charts

The PDF draws the vector chart; the Word export writes the same node as a Word chart, its numbers in an embedded workbook you edit through Edit Data.



Drawing becomes Word's own

In Word the divider below is a paragraph border, and the badge a drawn shape that holds its letters. The export report names both, since neither is the kind of node it was authored as.
