Inline highlight chips

Text on a rounded background, on the baseline **— inline code and status badges**. Add the `graph-compose` dependency from `io.github.demchaav`.

code(text) — monospace on a light chip, engine defaults

Run `./mvnw verify` before pushing, and `-Dtest=Name` to narrow it to one class

chip(text, fg, bg) — a coloured status badge between words

Paid Overdue On hold

highlight(text, style, bg, radius, padding) — the full primitive

Pill rounded square sharp

a multi-word highlight wraps across lines — one continuous fill per fragment

Reviewer note: this longer highlighted phrase is intentionally verbose so that it spans more than one visual line, and the engine still paints a continuous rounded chip on each line fragment rather than one box per word — done.
