GraphCompose

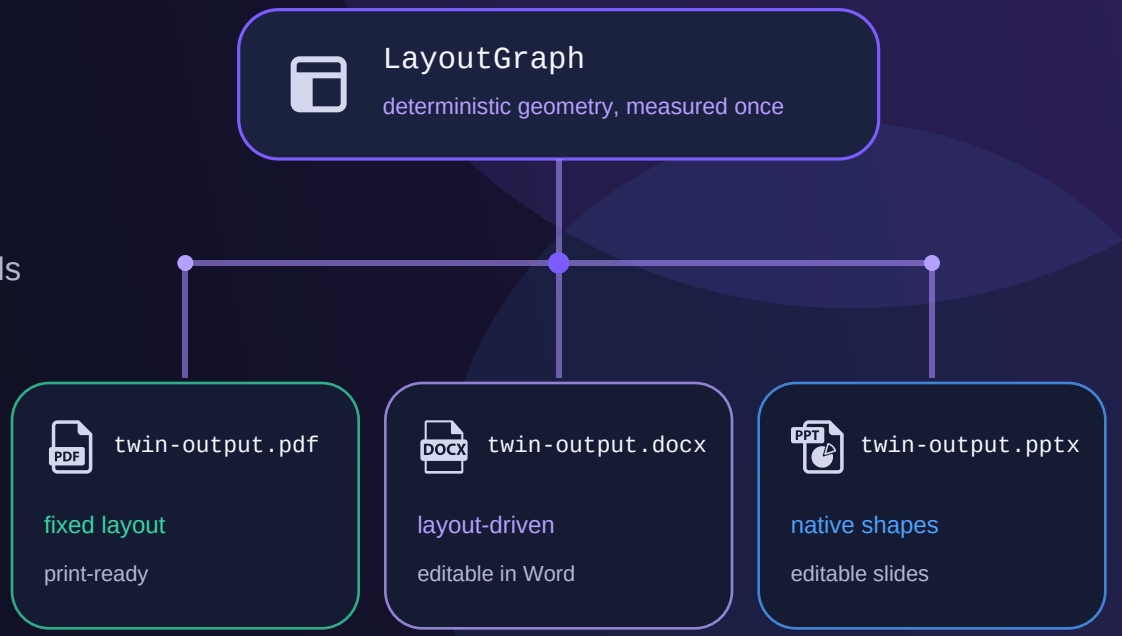
GRAPHCOMPOSE / ONE SOURCE, THREE FORMATS

Written once.
Rendered three times.

One Java composition, one resolved layout graph, three backends: a print-ready PDF, a PowerPoint slide of the same geometry and a Word document written from it - text, panels and vectors stay editable.

```
Path deck = Path.of("twin-output.pptx");
Path word = Path.of("twin-output.docx");
try (DocumentSession doc = GraphCompose
      .document(Path.of("twin-output.pdf"))
      .pageSize(DocumentPageSize.SLIDE_16_9)
      .create()) {
   compose(doc);                                  // one description
   doc.buildPdf();                                // print-ready PDF
   doc.buildPptx(deck);                           // editable PowerPoint
   doc.export(DocxSemanticBackend.builder()       // editable Word
         .deterministic(true).build(), word);
}
```

ONE RESOLVED LAYOUT / THREE BACKENDS



one layout graph - same metrics - same colours

- **one layout graph** — measured once
- **1 page = 1 slide** — identical geometry
- **shapes stay native** — edit in Word or PowerPoint
- **render-docx / render-pptx** — opt-in modules
