Page zones

The footer below is a row of nodes, not three text slots: a notice, a badge, a link and this page's number. The running head starts overleaf — appliesTo keeps it off this cover.

Drawn by the body's handlers

The chip has its rounded fill and the link is a real annotation, because the band is laid out and painted the same way the body is.

One zone, every backend

page.pageNumber() returns a node, so this same footer exports to DOCX as Word's live PAGE field rather than a number that would be wrong on every page but one.

Appendix

The head's page reference points here. It is the body's own anchor machinery — the zone compiles with the document's resolved anchors, so "Appendix · p.4" is looked up, not typed.
