Transforms and z-index

Rotate, scale, and explicitly stack layers — composed naturally on top of the existing shape-container DSL.

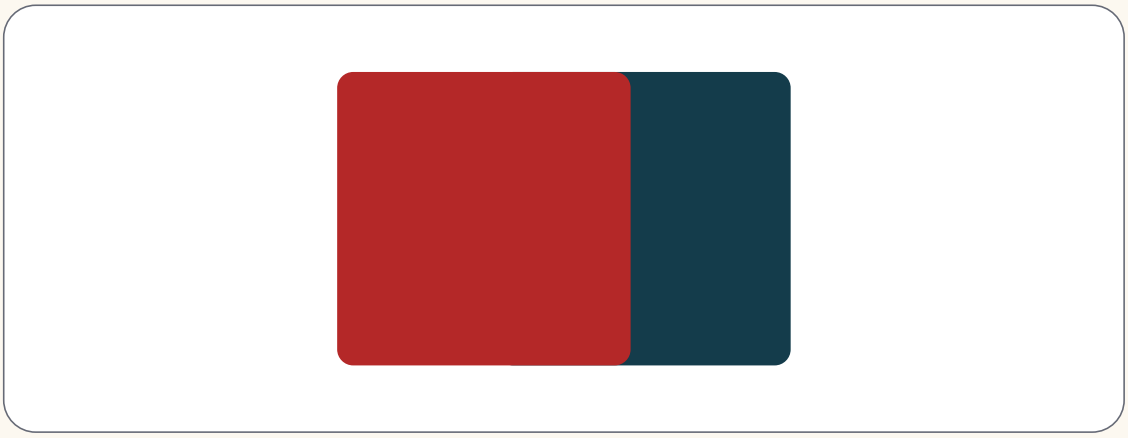
rotate(15)

Tilt left, tilt right, no tilt — outline plus label rotate together.

scale(...)

Scaling pivots around the outline centre and composes with rotate().

zIndex — re-stack layers without re-ordering source



RED.zIndex(10) draws on top of TEAL even though RED is declared first.
