Re: Senior Engineer

Northwind Systems Ltd.
Attention: Hiring Team — Document Platform
180 Strand · London WC2R 1EA · United Kingdom

I help teams ship **designed PDFs as code** — semantic Java DSL, deterministic layout, regression snapshots, and zero hand-tuned coordinates.

Most recently I shipped a templating engine for **invoices, proposals, and CVs** used by 1.2M monthly documents in production.

Dear Hiring Team,

I am writing to apply for the Senior Backend Engineer role on your Documents team. Over the past five years I have built and shipped PDF and DOCX rendering services that survive real production load, with deterministic regression coverage so design changes never silently break customer documents.

My current focus is on declarative document authoring — describing semantic intent and letting the engine resolve layout, pagination, and rendering. The same approach drives my open-source work on GraphCompose, where I separate semantic nodes from PDFBox rendering behind a public NodeDefinition seam, with snapshot tests that pin layout state before any byte is rendered.

Production scale

`1.2M docs / month`

Invoice + statement service for a fintech adopter; <0.01% render errors over 18 months.

Tooling depth

`Java 21 · PDFBox 3 · Apache POI`

Backend-neutral output options, deterministic snapshots, visual regression harness.

Design partnership

`Cinematic templates`

Tokenised business themes drive every visual choice — single source for invoice + proposal + CV.

I would welcome the chance to walk through the architecture and show how it could fit your platform. Sample renders, benchmark numbers, and the underlying source are all linked from the address above.

Sincerely,

Mariia Demchyshyn
